1 Summary

This National Chemical Contaminants Programme (NCCP) report provides a summary of results for raw milk and colostrum sampled over the full 2017/2018 dairy season, spanning the period 1 July 2017 to 30 June 2018, and tested for a range of residues and contaminants.

The purpose of the NCCP is to:

- determine whether 99% of milk produced in New Zealand conforms to New Zealand and international requirements for chemical residues and contaminants;
- establish baseline levels for specific constituents naturally present in milk;
- confirm the accuracy of attestations provided to other competent authorities; and
- investigate unfavourable findings to ensure that controls remain effective, that emerging hazards are identified, and appropriate regulatory measures are applied.

In addition to the NCCP monitoring of raw milk, dairy products are also sampled and tested for a range of residues and contaminants. These two programmes combine to provide a high level of confidence in the safety and suitability of New Zealand dairy products.

There were no results exceeding New Zealand maximum residue levels (MRLs), confirming that the programmes objective is being met and the rate of non-conformance for the compounds monitored remains below 1%.

2 NCCP Sampling and Testing

2.1 WHAT WE TESTED

- 305 raw milk samples were collected over 7 sampling rounds across the period 1 July 2017 to 30 June 2018 (308 milk samples in 2016/17); and
- 1 targeted colostrum round of 10 samples across the period 1 July 2017 to 30 June 2018 (10 in 2016/17).

All the randomly allocated sampling of raw milk and colostrum occurs at the farm bulk milk tank prior to any further consolidation, co-mingling or dilution with milk from other farms.

2.2 WHAT WE LOOKED FOR

More than 500 individual compounds or elements including:

- Contaminants
 - Aflatoxins
 - Chemical elements
 - Process contaminants and biocides
- Pesticides
 - Insecticides
 - Herbicides
 - Fungicides
- Veterinary medicines
 - Antibiotics
 - Anthelmintics
 - NSAIDS
- Other compounds such as withdrawn compounds or those not permitted for food producing animals

In total, 164,765 individual test results (excluding the milk integrity results) were obtained for raw milk and colostrum samples.

2.2.1 Milk Integrity

This report also includes a milk integrity summary that sets out the testing undertaken for compositional characteristics and components or minerals expected in milk. The purpose of this testing is to confirm that the levels for each component are within the expected range and that no form of adulteration or manipulation of the milk is occurring.

The milk and colostrum integrity results are summarised in Table 7.

2.3 ACTION LIMITS

Action limits are established for all residues of primary interest in the NCCP. Where maximum residue levels have been set, the action limit is typically the lowest value applied under New Zealand, Codex and importing country MRLs. Where a compound is not permitted, or not registered for use on milking animals, the action limit is at the laboratory method reporting limit.

For compounds or chemical elements naturally occurring in raw milk, the actions limits are set to identify unexpected levels that warrant further investigation. While unexpected levels will often be due to natural influences, the investigation aids MPI's understanding of the issue and ensures that no form of adulteration or inappropriate farming practice is occurring.

3 Results

3.1 RAW MILK

Of the 159,355 individual test results for raw milk (excluding colostrum), there were 211 reported detections (0.13%) above the agreed method reporting limit. Four results were above the action limit (0.0025%):

- 1 detection of cyanuric acid (0.11 mg/kg) above the action limit of 0.1 mg/kg;
- 3 detections of bismuth (0.58 to 0.93 mg/kg) above the action limit of 0.5 mg/kg.

There were no results from the testing of agricultural compounds including veterinary medicines that exceeded New Zealand MRLs, confirming that the programmes objective is being met and the rate of non-conformance for the compounds monitored remains below 1%.

The detections are in Tables 1 and 2 and discussed following each table.

3.2 COLOSTRUM

Of the 5,410 individual test results for colostrum, there were 34 reported detections (0.63%) above the agreed method reporting limit. Three results were above the action limit (0.055%).

- 2 detections of temephos (0.023 and 0.034 mg/kg) above the action limit of 0.01 mg/kg;
- 1 detection of bismuth (0.59 mg/kg) above the action limit of 0.5 mg/kg.

There were no results from the testing of agricultural compounds including veterinary medicines that exceeded New Zealand MRLs, confirming that the programmes objective is being met and the rate of non-conformance for the compounds monitored remains below 1%.

The detections are in Tables 1 and 2 and are discussed following each table.

3.3 DETECTIONS ABOVE ACTION LIMITS

Table 1: Compounds detected in raw milk and colostrum samples reported above the action limit

Compound	Matrix	Samples tested	Not detected	Detection above reporting limit	Detection above action limit	Flag	Action limit (mg/kg)	LoR (mg/kg)	Method	Code***
Bismuth	Milk	305	188	117	3	●	0.5	0.001	Acid Digest/ICP-MS	EL
Bismuth	Colostrum	10	5	5	1	●	0.5	0.001	Acid Digest/ICP-MS	EL
Cyanuric Acid	Milk	59	58	1	1	●	0.1	0.1	LC-MS/MS	O
Temephos	Colostrum	10	8	2	2	●	0.01	0.005	LC-MS/MS	P

Notes

*** Refer to Table 9 for code

● The test result was above the action limit

3.3.1 Bismuth

In New Zealand bismuth is exempt from an MRL when used as a teat sealant.

Bismuth is an inert compound used in teat sealants when cows are dried off at the end of lactation. Teat sealant products have been shown to be highly effective in minimising mastitis incidence during the dry period which, in turn, means that there is less reliance on antibiotic treatments during the early stages of lactation.

Findings above the action limit in milk indicates that farm dairy operators are either not administering teat sealant products correctly, with the sealant moving beyond the teat canal, or the teat sealant is not being effectively stripped at the first milking after calving. While this is not of concern to food safety, MPI will none-the-less look at opportunities to promote good practice.

Because of its nature and the levels of bismuth found, these findings are not considered to be of any concern to public health and further investigation was not necessary. MPI will review the action limit for bismuth.

3.3.2 Cyanuric Acid

Cyanuric acid is a known metabolite of several pesticides and agricultural compounds. Other sources of cyanuric acid may include feed additives or water treatment disinfectants. A cow milk sample was found with a cyanuric acid level at 0.11 mg/kg. The action limit for this compound is at 0.10 mg/kg. The investigation found that the levels of cyanuric acid in raw milk likely resulted from the farm operator not rinsing the plant following an alkali wash and was not linked to any form of milk or feed adulteration.

3.3.3 Temephos

Temephos is an organophosphate compound registered in New Zealand for the treatment of lice on cattle and non-lactating dairy animals. The detections in two colostrum samples is not unexpected and below any level that would be of concern in milk or dairy products.

3.4 OTHER DETECTIONS BELOW ACTION LIMITS

Table 2: Compounds detected in raw milk and colostrum samples above agreed method reporting limits and below action limits

Notes

*** Refer to Table 9 for code

● The amount reported did not exceed the action limit threshold

**** Action limit applies to p,p'-DDE and to the sum of p,p'-DDT, o,p'-DDT, p,p'-DDE and p,p'-TDE (DDD), corrected to milk with 4% milkfat

* Confirmatory testing following presumptive positive result

3.4.1 Inhibitory substances

Ampicillin was detected in three colostrum samples and cephalonium was detected in one colostrum sample. In none of these instances was the action limit exceeded. These compounds are commonly found in dry cow therapies so low level detections are not unexpected in colostrum.

3.4.2 Chemical elements

Arsenic, lead and tin were reported in milk and colostrum. The reported levels did not exceed action limits. Given the relatively low level of industrialisation in New Zealand, there is little heavy metal contamination within the environment. As milking cows primarily graze pasture and receive relatively small quantities of feed from external sources, it is unlikely for contamination to occur through the feed supply. These results are not unexpected and are below any level of concern in milk or dairy products.

Lead is a ubiquitous environmental contaminant, albeit usually at very low levels in New Zealand. Isolated higher levels are likely to be associated with anthropogenic sources of lead from such uses as historical storage sites for leaded petrol, leaching from lead shot or fishing lures, ash contamination from incinerators and residues from historical use of lead arsenate insecticides, (discontinued) lead paints and discarded batteries. Appropriate controls and advisories are already in place for most of these potential sources. The levels of lead reported in the milk and colostrum samples were all below the action limits. These results are not unexpected and are below any level that would be of concern in milk or dairy products.

3.4.3 Pesticides

Diphenylamine was detected in five milk samples and two colostrum samples. Diphenylamine may be used in rubberware as well as being associated with some dyes. All detections were below the action limit. Never-the-less, MPI is working with industry to identify likely sources and minimise exposure to milk or milking animals.

DDE (p,p') was detected in 38 milk samples and four colostrum samples. All detections were below the action limit. While the use of DDT in New Zealand agriculture was effectively banned in the early 1970s, the DDE metabolite has been shown to have a very long half-life (in excess of 25 years) in

some soils under certain situations. Circumstances that result in higher than normal soil ingestion (such as droughts, use of certain crops or even very wet winters) can, on occasion, result in some animals having a slightly higher exposure.

3.4.4 Phthalates

Bis(2-ethylhexyl) adipate (DEHA) was reported in one milk sample and diethyl phthalate (DEP) was reported in one milk sample. The reported levels did not exceed action limits. DEHA is not a phthalate of high concern and its action limit has been established based on levels of the compound reasonably expected to be found in milk or dairy products. DEHA has replaced DEHP in some food contact materials (such as milking cup liners). DEP is a phthalate ester that is ubiquitous in the environment. DEP is mainly used as a plasticiser, solvent and in cosmetics and insecticides. Low level detections of DEHA and DEP are not unexpected.

3.4.5 Quaternary Ammonium Compounds (QACs)

Benzylidimethyldodecylammonium chloride (BDM-C12) was reported in one colostrum sample. The reported level did not exceed the action limit. QACs are widely used as surfactants and disinfectants though use within the dairy industry has reduced significantly over recent years. Several products are approved for sanitising dairy equipment, including use at farm dairies. All dairy maintenance compounds containing QACs have been approved in New Zealand with the condition that milk contact surfaces are to be rinsed after use.

3.5 OTHER TOOLS TO SUPPORT THE NCCP

All testing under the programme is also supported by:

- on-farm verification of milking practices (under MPI direction);
- the testing by industry required by MPI under the risk management programmes; and
- industry monitoring for chemical residues or contaminants determined to be necessary when applying Codex HACCP Principles.

These additional data give further confidence that New Zealand dairy farmers are protecting the quality and integrity of the milk they produce.

4 Conclusion

The practice of sampling raw milk and colostrum at the farm prior to consolidation through collection and processing, allows for conclusions to be made with respect to New Zealand farmer compliance with both Good Agricultural Practice (GAP) and Good Practice in the Use of Veterinary Drugs (GPVD)¹. As with previous years, these results provide a high level of confidence that New Zealand has appropriate controls in place to ensure its milk and milk products will continue to consistently meet both the New Zealand and the relevant international standards for chemical residues and contaminants.

Furthermore, the Ministry for Primary Industries has a standard policy that requires all unusual or unexpected results, regardless as to whether it they came from a government or industry sample, to be investigated for the potential cause and initiate either local or system corrective actions as appropriate.

The overall rate of all detections (above the agreed method reporting limits) continues to be very low and in the 2017/2018 year was 0.15%. This is within the range of the overall rate of detections reported in previous years (Figure 1).

Notes

Results which are confirmed using a validated test and exceed the reporting limit or action limit are reported. Presumptive positives which are found using a qualitative method are not reported.

[compound]* Compounds are included even though the method may not detect down to action limits as it will still enable the conformance of milk at delivery to the processing premises to be assessed

*** Refer to Table 9 for code

**** Action limit applies to p,p'-DDE and to the sum of p,p'-DDT, o,p'-DDT, p,p'-DDE and p,p'-TDE (DDD) corrected to milk with 4% milkfat

● The amount reported did not exceed the action limit threshold

● The test result was above the action limit

5.3 COLOSTRUM RESULTS – DETECTIONS

Notes

Results which are confirmed using a validated test and exceed the reporting limit or action limit are reported. Presumptive positives which are found using a qualitative method are not reported.

[compound]* Compounds are included even though the method may not detect down to action limits as it will still enable the conformance of milk at delivery to the processing premises to be assessed

*** Refer to Table 9 for code

**** Action limit applies to p,p'-DDE and to the sum of p,p'-DDT, o,p'-DDT, p,p'-DDE and p,p'-TDE (DDD) corrected to milk with 4% milkfat

● The amount reported did not exceed the action limit threshold

● The test result was above the action limit

5.5 MILK INTEGRITY

Table 7: Raw milk and colostrum samples integrity results

Compound	Matrix	Samples tested	Not detected	Present at or within expected limits	Present outside expected limits	Flag	Expected limit	Min	Max	Method	Code
Aluminium	Milk	305	248	57	1	●	max. 1.0 mg/L	n.d.	1.0018	Acid digest/ICP-MS	EL

IgG1	Colostrum	10	0	10	0		min. 2.0 g/L	3.85	19.66	NIA	MC
Sodium Thiocyanate	Milk	59	3	56	0		max. 20 mg/L	n.d.	13	HPLC-UV	O
Total		3209	1179	2030	8						

Notes

n.d. Refers to not detected at the test methods limit of detection or outside the calibration range for the component

● Results outside the expected limit or range of expected limits

6 Appendices

6.1 CODE AND METHOD INFORMATION

Table 8: Test method descriptions

Method	Description
FTIR	Fourier-transform infrared spectroscopy
GC-ECD	Gas chromatography with electron capture detection
GC-MS/MS	Gas chromatography tandem mass spectrometry
HPLC	High-performance liquid chromatography
HPLC-UV	High-performance liquid chromatography with ultraviolet detection
ICP-MS	Inductively coupled plasma mass spectrometry

Method	Description
LC-MS/MS	Liquid chromatography tandem mass spectrometry
MIT	Screen test using 4-plate microbial inhibition test (plate bioassay)
NIA	Nephelometric immune assay

Table 9: Compound and compound group codes

Code	Compound or compound group
A6	An ‘unauthorised substance’ as listed in Annex 1, Group A (6) of Directive 96/23/EC
AF	Aflatoxins
AN	Anthelmintics
C	Dicyandiamide (DCD)
D	Dexamethasone
EL	Chemical element
IS	Inhibitory substance
MC	Milk component
N	Nitrofurans
NS	Non-steroidal anti-inflammatory drugs (NSAIDs)
O	Other – cyanuric acid, melamine, glyphosate, 1080, sodium thiocyanate
P	Pesticides
PC	Polyether coccidiostats
Pht	Phthalates
QAC	Quaternary ammonium compounds

6.2 SUMMARY OF YEAR ON YEAR TESTING

Table 10: Summary of samples tested and overall rate of detections by year

Sampling Season	Number of milk samples	Number of colostrum samples	Overall rate of detections
2017/18	305	10	0.15%
2016/17	308	10	0.15%
2015/16	306	10	0.10%
2014/15	311	11	0.05%
2013/14	311	28	0.07%
2012/13	317	29	0.07%
2011/12	303	47	0.06%
2010/11	329	40	0.08%
2009/10	321	40	0.13%

Figure 1: Summary of overall rate of detections by year
